CITY ELEMENTS offers architects and urban planners a comprehensive lighting system that answers virtually every lighting need and even more. Thanks to the variety and versatility of its elements, the system goes beyond just lighting, offering solutions for public utilities, CCTV systems and other inner-city requirements.

With its three different pole diameters and variable heights up to 9 metres, CITY ELEMENTS easily configures to match the specific architectural environment proportionately and harmoniously.

EMDELIGHT®-GLASS  
Doha, Qatar

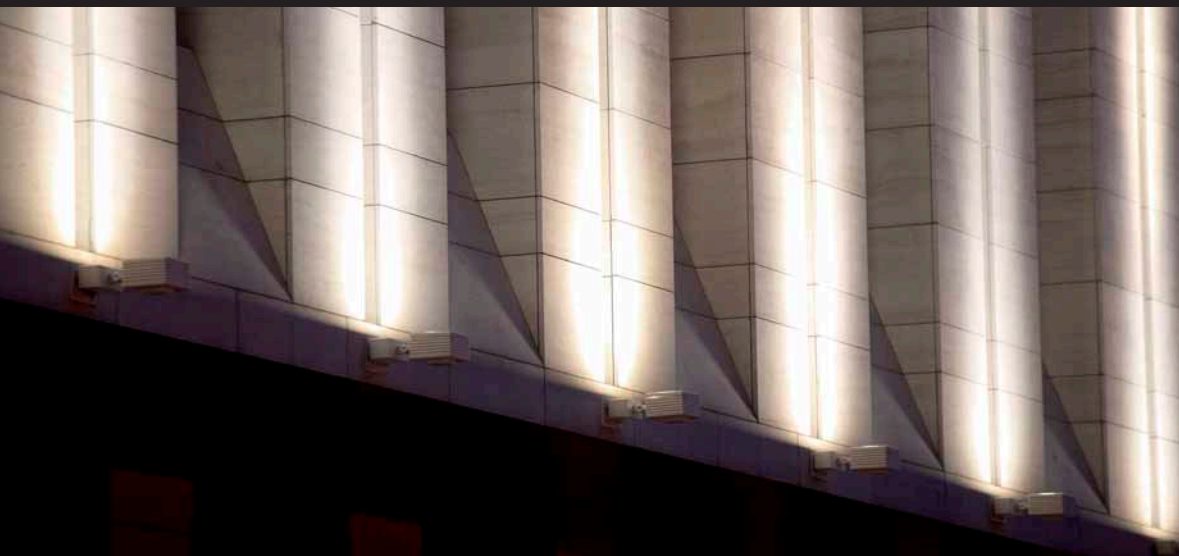

- Light emits from one or two opposing edges of the glass into the glass.
- The glass is coated with a white or coloured screen pattern.
- Each dot screens the emitted light according to the screen configuration.
- The screen structure is calculated based on panel size and pane thickness to produce a harmonious distribution of light throughout the glass.
- The panes are coated with ceramic inks. The ink is baked to create a durable coat that is scratch-proof, colour-fast, acid and alkaline resistant and thermally stable.
- The average coating coverage of 12 to 15 percent per pane largely preserves the transparent character.
- Glass with a low iron oxide content (white glass), which is especially pure and clear, is used.
